                                                                                                               comprising a
                                                                                                                       The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatability complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is chicken MHC class I peptide antigen
                                                            A new antigenic complex comprising epitopes non-covalently joined to a heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy.

The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatability complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is Herpes simplex virus MHC class I peptide antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Heat shock protein; hsp; conjugate peptide; benzoquinone ansamycin; infectious disease; human papillomavirus; herpes virus; retrovirus; hepatitis virus; influenza virus; thinovirus; respiratory syncytial virus; cytomegalovirus; adenovirus; malignant disease; neoplastic disease; sarcoma; lymphoma; leukaemia; melanoma; carcinoma; breast; prostate; ovary; cervix; uterus; colon; lung; glioblastoma; barrocytoma; immunological disease; AIDS; autoimmune disease; rheumatoid arthritis; systemic lupus erythematosus; diabetes mellitus; thyroiditis; multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identification of a peptide binding to a heat shock protein involves contacting a phage display library of several bacteriophages expressing in a surface protein of inserted peptides with a target followed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invertion Featers to a method for its paperide binding to a heat shock protein (hap) involving contacting a phage display to a library of several bacteriophage which express, in a surface protein, several inserted peptides which an hap target or hap target bound to a benzoquinone ansamycin antibiotic in a physiological binding buffer or binding buffer, isolating the phage, and identifying the inserted peptide expressed in the surface protein of the phage. The method is useful for identifying a peptide, which binds to a heat shock protein, which is used in a conjugate peptide for inducing an immune response, for the treatment of in a conjugate peptide for inducing an immune response, for the treatment of in a conjugate peptide for inducing an immune response, for the treatment of papillomavirus, a herpes virus such as herpes simplex virus, a retrovirus such as human immunodeficiency virus in 2, a hepatitis virus, an influenza virus, a rathnovirus, respiratory syncytial virus, an conformation and an adenovirus, respiratory syncytial virus, an influenza virus, a rathnovirus, streptococcus, Enterococcus, Covernidum, Bachericinia, Klabaiella, Vibrio on Mycobacterium of the protezon such as an amoeba, malarial parasite or Trypanosoma cruzi), or malignant diseases, for treating or preventing neoplastic diseases (correctionma of the prostate, ovarian carcinoma, carcinoma of the brease.

Correctionma of the prostate, ovarian carcinoma, carcinoma of the cervix, cuterine carcinoma, or immunological diseases (e.g. AlDS) and for treating autoimmune diseases such as rheumatoid arthritis, systemic lupus carcinom of expression carcinoma of the invention.

Correctionment of seases such as rheumatoid arthritis, systemic lupus carcinom of the sequence represents an hap related peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                        invention relates to a method for identification of a peptide binding

                                                                                                                                                                                                                                        This invention relates to a novel hybrid antigen which comprises at least one antigenic domain of an infectious agent or tumour antigen and a binding domain that non-covalently binds to a heat shock protein. The invention may be useful for the production of compounds with an antimicrobial or cytostatic activity. In addition, the invention may prove useful for the production of a vaccine or for gene therapy. The composition and methods disclosed are useful for preventing or treating infectious diseases or cancer. The present sequence is that of a peptide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hybrid antigen; antigenic domain; infectious agent; tumour antigen; binding domain; heat shock protein; antimicrobial; cytostatic; vaccine; gene therapy; infectious disease; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Andielic S;

The invention may be useful for the production of compounds with an antimicrobial or cytostatic activity. In addition, the invention may prove useful for the production of a vaccine or for gene therapy. The composition and methods disclosed are useful for preventing or treating infectious diseases or cancer. The present sequence is that of a peptide which was used in the exemplification of the invention.

The peptide given in AAM19966 comprises a fusion of HCV E7.2 (Type 6b) peptide and BiP binding domain. The hybrid peptide is combined in vitro with a HSP to form a complex that, when administered to a subject, induces an immune response against HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Compsn. for inducing immune response contg. antigen and heat shock protein - also new hybrid peptide and related nucleic acid, for treatment of infectious diseases and tumours.

                                                                                                                                                                                                                                                                                                                                                                                                   Hybrid peptides (AAW19958-67) for use in vaccines against human papilloma virus (HPV) comprise an HPV antigenic peptide joined via a peptide linker to a heat shock protein BiP binding domain (see also AAW19951). The peptide given in AAW19961 comprises a fusion of BiP binding domain and HCV E7 (type 16) peptide. The hybrid peptide is combined in vitro with a HSP to form a complex that, when administered to a subject, induces an immune response against HCV

Compsn. for inducing immune response contg. antigen and heat shock protein - also new hybrid peptide and related nucleic acid, for treatment of infectious diseases and tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hybrid peptides (AAW19958-67) for use in vaccines against human papilloma virus (HPW) comprise an HPV antigenic peptide joined via a peptide linker to a heat shock protein BiP binding domain (see also AAW19951). The peptide given in AAW19967 comprises a fusion of BiP binding domain and HCV B7.2 (type 6b) peptide. The hybrid peptide is combined in vitro with a HSP to form a complex that, when administered to a subject, induces an immune response against HCV
/accine; immunotherapy; heat shock protein; BiP; human papilloma virus;

                                                                                                                                                                                                                                                                                              Compsn. for inducing immune response contg. antigen and heat shock protein - also new hybrid peptide and related nucleic acid, for treatment of infectious diseases and tumours.
                                                                                                                                                                                                                                                                                                                                                                                           Hybrid peptides (AAM19958-67) for use in vaccines against human papilloma virus (HPV) comprise an HPV antigenic peptide joined via a peptide linker to a heat shock protein BiP binding domain (see also AAM1951). The peptide given in AAM19960 comprises a fusion of HCV E7 (type 16) peptide and BIP binding domain. The hybrid peptide is combined in vitro with a HSP to form a complex that, when administered to a subject, induces an immune response against HCV

Hybrid peptides (AAW19958-67) for use in vaccines against human papilloma virus (HPV) comprise an HPV antigenic peptide joined via a peptide linker to a heat shock protein BiP binding domain (see also AAW19951). The peptide given in AAW19959 comprises a fusion of BiP binding domain and HCV B7 (type 11) peptide. The hybrid peptide is combined in vitro with a HSP to form a complex that, when administered to a subject, induces an immune response against HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Compsn. for inducing immune response contg. antigen and heat shock protein - also new hybrid peptide and related nucleic acid, for treatment of infectious diseases and tumours.
a HSP to form a complex that, when administered to a subject, induces an immune response against \ensuremath{\mathsf{HCV}}
                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccine; immunotherapy; heat shock protein; BiP; human papilloma virus;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ŝ
                                                                                                                                                                                                                                                                                                       ô
                                                                                     Hybrid peptides (AAW19958-67) for use in vaccines against human papilloma virus (HPV) comprise an HPV antigenic peptide joined via a peptide linker to a heat shock protein BiP binding domain (see also AAW19951). The peptide given in AAW19964 comprises a fusion of HCV E7.1 (Type 6b) peptide and BiP binding domain. The hybrid peptide is combined in vitro with a HSP to form a complex that, when administered to a subject, induces an immune response against HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hybrid peptides (AAW19958-67) for use in vaccines against human papilloma virus (HPV) comprise an HPV antigenic peptide joined via a peptide linker to a heat shock protein BiP binding domain (see also AAW19951). The peptide given in AAW19965 comprises a fusion of BiP binding domain and HCV B7.1 (type 6b) peptide. The hybrid peptide is combined in vitro with
 protein - also new hybrid peptide and related nucleic acid, for treatment of infectious diseases and tumours.

Hybrid peptides (AAW19958-67) for use in vaccines against human papilloma virus (HPV) comprise an HPV antigenic peptide joined via a peptide linker to a heat shock protein BiP binding domain (see also AAW19951). The peptide given in AAW19958 comprises a fusion of HCV E7 (type II) peptide and BiP binding domain. The hybrid peptide is combined in vitro with a HSP to form a complex that, when administered to a subject, induces an immune response against HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Compsn. for inducing immune response contg. antigen and heat shock protein - also new hybrid peptide and related nucleic acid, for treatment

The peptide given in AAW19963 comprises a fusion of BiP binding domain and HCV B7 (type 18) peptide. The hybrid peptide is combined in vitro with a HSP to form a complex that, when administered to a subject, induces an immune response against HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Compsn. for inducing immune response contg. antigen and heat shock protein - also new hybrid peptide and related nucleic acid, for treatment of infectious diseases and tumours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                               The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GA2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                               Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                         Gарв

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule, where the melanoma shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AUV12980-AAUV2481 represent melanoma antigen peptides of the invention
                                                                                                                                        melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Melanoma antigen; MART-1; MAGE-1; gpl00; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYEs01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.

an immune response,

WPI; 2001-663092/76

```
comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                               cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cancer vaccine for the treatment of melanoma comprises a heat shock

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase antigens, BAGE antigens, NYEsO1, MART antigen from tyrosinase and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAV1980-AAV72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cancer vaccine for the treatment of melanoma comprises a heat shock

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUTIS80-ANUT2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti cancer vaccine for the treatment of melanoma comprises a heat shock

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase. Vyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigen is covalently bound to a javelin molecule, where the melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980.AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       melanoma comprises a heat shock

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase antigens, BAGE antigens, NYEsOl, MART antigen from tyrosinase and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANVI1980-AAVI2481 represent melanoma antigen peptides of the invention

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen. Where the melanoma antigen selected from tyrosinase, tyrosinase related protein 1, tyrosinase antigens (AR, antigens, AR, antigens, AR, antigens, AR, antigens, AR, antigens, AR, antigens and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                   Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase BAGE; NYESO1; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of induction of an immune response,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 64; DB 4; Length 20; 100.0%; Pred. No. 0.0085; tive 0; Mismatches 0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gp100-derived melanoma antigen, javelin peptide #73.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mayhew M,
                                                                                              protein and a melanoma antigen i.e. tyrosinase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock procein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigen is covalently bound to a javelin molecule, where the melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUTI980-AAUTI281 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; WYSB61; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T celle-1; human.

             a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase protein 2, gp 100, MAGE antigens, BAGE antigens, NVES01, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAV71980-AAV72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYEGU, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javalin molecule, where the melanoma antigen bound to the javelin molecule, where the melanoma shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
comprising administration of an immunotherapeutic composition, comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Anti cancer vaccine for the treatment of melanoma comprises a heat shock
protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYBS01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of induction of an immune response
                                                                                                                                                                                                                                                                           Gaps

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. ANUT1980-AAUT2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYEs01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYES01, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

```
comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigent portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule, is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANV1980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                 melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYEs01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of induction of an immune response,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 64; DB 4; Length 20; 100.0%; Pred.                          comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, Lyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens GM2, antigent portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase, tyrosinase related protein 1, tyrosinase antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule, where the melanoma antigen bound to the javelin molecule, and to the seasonse shock protein. The composition is useful for inducing an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase BAGE; NYSB01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T cells-1; human.
The invention relates to a method of induction of an immune response,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      comparising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigen is covalently bound to a javelin molecule, where the melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUTIS80-AAUTIS481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Anti cancer vaccine for the treatment of melanoma comprises a heat shock

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase, related protein 1, tyrosinase, ratigence, BAGE antigens, NYESG1, MART antigens, GMZ, antigence portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUTIS80-AAUTIS481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                     Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYE801; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.
javelin molecule; melanoma antigen recognised by T cells-1; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, BAGE antigens, NYESU, MART antigen, GNY, antigenfc portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. ANUTISBO-ANUT2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cancer vaccine for the treatment of melanoma comprises a heat shock

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase antigens, GM2, antigent portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AMU71980-AMU72481 represent melanoma antigen peptides of the invention
                                                                                                    melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYBSE01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; favelin molecule; melanoma antigen recognised by T cells-1; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                  comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigent portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AMV11980-AAV72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                             Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Melanoma antigen, MART-1, MAGE-1, gp100, cytostatic; immune response; immuncharapetic; heat shock protein; tyrosinase; BAGE; NYSB61, GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of induction of an immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock procein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase ratigents, BAGE antigens, NYESO1, MART antigent of the fire portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUTIS80-AAUTI281 represent melanoma antigen peptides of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, MYES01, MART antigens, GMY, antigens, Gportions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AdVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention

The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompactability complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is human gpl00 MHC class I mutant peptide antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A new antigenic complex comprising epitopes non-covalently joined to a heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of induction of an immune response, comprising administration of an immunotherspeutic composition. Comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase antigen, GMZ, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AMJ71980-AAM72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                            Melanoma antigen, MART-1, MAGE-1, gp100; cytostatic, immune response; immunotherspeptic; heat shock protein; tyrosinase; BAGE; NYESO1, GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatability complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is human gplo0 MHC class I mutant peptide antigen
                                                                                                                                                                                                                                                                                                              A new antigenic complex comprising epitopes non-covalently joined to a heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hybrid antigen; antigenic domain; infectious agent; tumour antigen; binding domain; heat shock protein; antimicrobial; cytostatic; vaccine; gene therapy; infectious disease; cancer.

This invention relates to a novel hybrid antigen which comprises at least one antigenic domain of an infectious agent or tumour antigen and a binding domain that non-covalently binds to a heat shock protein. The invention may be useful for the production of compounds with an antimicrobial or cytostatic activity. In addition, the invention may prove useful for the production of a vaccine or for gene therapy. The composition and methods disclosed are useful for preventing or treating infectious diseases or cancer. The present sequence is that of a peptide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hybrid antigen; antigenic domain; infectious agent; tumour antigen; binding domain; heat shock protein; antimicrobial; cytostatic; vaccine; gene therapy; infectious disease; cancer.
                                                                                                                                                                                                                                                                                                                                                      Prince-Cohane K, Mehta S, Slusarewicz P, Andjelic S;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New hybrid antigens comprising an antigenic domain and improved behock protein-binding domains, useful for preventing or treating infectious diseases or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 64; DB 8; Length 20; 100.0%; Pred. This invention relates to a novel hybrid antigen which comprises at least one antigenic domain of an infectious agent or tumour antigen and a binding domain that non-covalently binds to a heat shock protein. The invention may be useful for the production of compounds with an antimicrobial or cytostatic activity. In addition, the invention may prove useful for the production of a vaccine or for gene therapy. The composition and methods disclosed are useful for preventing or treating infectious diseases or cancer. The present sequence is that of a peptide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     hybrid antigen; antigenic domain; infectious agent; tumour antigen; binding domain; heat shock protein; antimicrobial; cytostatic; vaccine; gene therapy; infectious disease; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel hybrid antigen which comprises at le one antigenic domain of an infectious agent or tumour antigen and a binding domain that non-covalently binds to a heat shock protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel hybrid antigen which comprises at least one antigenic domain of an infectious agent or tumour antigen and a binding domain that non-covalently binds to a heat shock protein. The invention may be useful for the production of compounds with an antimicrobial or cytostatic activity. In addition, the invention may prove useful for the production of a vaccine or for gene therapy. The composition and methods disclosed are useful for preventing or treating infectious diseases or cancer. The present sequence is that of a peptide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  hybrid antigen; antigenic domain; infectious agent; tumour antigen; binding domain; heat shock protein; antimicrobial; cytostatic; vaccine; gene therapy; infectious disease; cancer.

invention may be useful for the production of compounds with an antimicrobial or cytostatic activity. In addition, the invention may prove useful for the production of a vaccine or for gene therapy. The composition and methods disclosed are useful for preventing or treating infectious diseases or cancer. The present sequence is that of a peptide which was used in the exemplification of the invention.
                                                                                                                                                                                                            Sequence 20 AA;

Hybrid antigen useful for treating an infectious disease or cancer, comprises an antigenic domain from the infectious agent or cancer joined to a heat shock protein binding domain through an improved linker peptide

Example 2; Page 59; 99pp; English

The invention relates to hybrid antigens comprising at least one antigenic domain of an infectious agent or tumour antigen, at least one binding domain that non-covalently binds to a heat shock protein (hsp), and at least one peptide linker between them. Also disclosed are: (a) a composition for inducing an immune response to an infectious agent or tumour antigen comprising at least one of the hybrid antigens or a complex of at least one heat shock protein and at least one of the hybrid antigens, (b) a method for inducing an immune response to an infectious agent or tumour antigen by administering a hybrid antigen and a heat shock protein, where the hybrid antigens and the heat shock protein are non-covalently bound, and (c) treating an infectious disease or cancer by

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. ANUT1980-AAUT2481 represent melanoma antigen peptides of the invention
administering a hybrid antigen and a heat shock protein. The heat shock protein is preferably hep70. The composition is administered via oral or parenteral route. The hybrid antigen is useful in preparing a composition for treating or preventing cancer or infectious disease. The new peptide linkers give the antigens improved activity. Note: Many of the SEQ ID Nos are replicated more than once in the specification but the sequences of these replicated SEQ ID Nos are not the same. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    melanoma comprises a heat shock

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase, ratigens of the selected protein 2, gp 100, MAGE antigens, BAGE antigens, NYEs01, MART antigens, GM2, antigens portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase antigens, CM2, antigence portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAV71980-AAV72481 represent melanoma antigen peptides of the invention

comprising administration of an immunotherapeutic composition, Comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYEG1, MART antigens, GM2, antigent cortions and combinations of these. The melanoma antigen bound to the javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                          melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYEs01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of induction of an immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 64; DB 4; Length 21 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, BAGB antigens, NYBsO1, MART antigens, GM2, antigenc portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANT/1980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising

                                                                                                                                                                                                                                                                         comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a minmunotherapeutic composition, comprising a heat shock protein, and a malanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYES01, MART antigens (GMZ, antigenic portions and combinations of these. The melanoma antigen bound to the javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AMV11980-AAV72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                   comprises a heat shock

ö
a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase protein 2, gp 100, MAGE antigens, BAGE antigens, NVES01, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Anti cancer vaccine for the treatment of melanoma comprises a heat shock

```
The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, BAGS antigens, NYESO1, MART antigens, GM2, antigens portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. ANUT1980-AAU72481 represent melanoma antigen peptides of the invention

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase entelated protein 2, gp 100, MAGE antigens, BAGE antigens, NYES01, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Melanoma antigen, MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase abdEs NYBS01; GMZ; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T cells-1; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYEG1, MART antigens, GN2, antigenic portions and combinations of these. The melanoma antigen bound to the javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. ANVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the treatment of melanoma comprises a heat shock

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYES01, MART antigens, GMZ, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AdVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                   Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYE801; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase ratigence from tyrosinase, compositions of these. The melanoma antigens, GMZ, antigent cortions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANT/1980-AAU7/2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                        Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYEs01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, WART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the had shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUTIS80-AAUTIS81 represent melanoma antigen peptides of the invention

                                                                                                                                                   The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase ratigens, CM2, antigence portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANV1980-AAV72481 represent melanoma antigen peptides of the invention

MAGE-1-derived melanoma antigen, javelin peptide #23.

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, MAGE antigens, MA, antigens, MA, antigens, MA, antigens, MA, antigens portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AdVI1980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma shigen is covalently bound to a javelin molecule, where the melanoma shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUT1980-AAUT2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                    Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; hat shock protein; tyrosinase; BAGE; NYESO1; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T celle-1; human.

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen; where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, GM2, antigens portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule, where the melanoma shock protein. The composition is useful for inducing an immune response for the treatment of melanoma.

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, pacted from tyrosinase, tyrosinase related protein 1, tyrosinase antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          vaccine for the treatment of melanoma comprises a heat shock a melanoma antigen i.e. tyrosinase.
                                                                             melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYEs01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                 The invention relates to a method of induction of an immune response,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule, where the melanoma shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                       melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYES01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.

The melanoma antigen is covalently bound to a javalin molecule, where the melanoma antigen bound to the javalin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response
            comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, sp 100, MAGE antigens, BAGE antigens, NYES01, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen bound to the javelin molecule, where the melanoma antigen bound to the javelin molecule; where the melanoma shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. ANVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     vaccine for the treatment of melanoma comprises a heat shock a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunothorapeutic; heat shock protein; tyrosinase; BAGE; NYESO1; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                      Gaps
The invention relates to a method of induction of an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the invention relates to a method of induction of an immune response.

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAV71980-AAV72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, MAGE antigens, MA, antigens, MA, antigens, MA, antigens of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AdVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   444444444
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel hybrid antigen which comprises at least one antigenic domain of an infectious agent or tumour antigen and a binding domain that non-covalently binds to a heat shock protein. The invention may be useful for the production of compounds with an antimicrobial or cytostatic activity. In addition, the invention may prove useful for the production of a vaccine or for gene therapy. The composition and methods disclosed are useful for preventing or treating infectious diseases or cancer. The present sequence is that of a peptide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                        hybrid antigen; antigenic domain; infectious agent; tumour antigen; binding domain; heat shock protein; antimicrobial; cytostatic; vaccine; gene therapy; infectious disease; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ŝ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New hybrid antigens comprising an antigenic domain and improved heat shock protein-binding domains, useful for preventing or treating infectious diseases or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Andjelic
